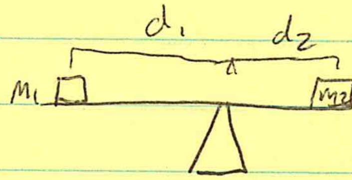
12.4 Applications: students should review 7.5

Center of Mass

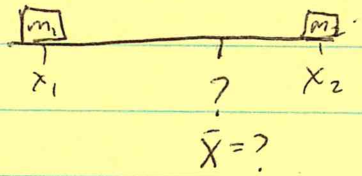


balences $\Leftrightarrow m_1 d_1 = m_2 d_2$.

Law of the Lever

Archimedes ~ 200 B.C.

Suppose we have



. How do we find the balance pt $\bar{x}$?

Let $d_1 = \bar{x} - x_1$, $d_2 = x_2 - \bar{x}$.

Then $m_1(\bar{x} - x_1) = m_2(x_2 - \bar{x}) \Rightarrow \bar{x} = \dfrac{m_1 x_1 + m_2 x_2}{m_1 + m_2}$.

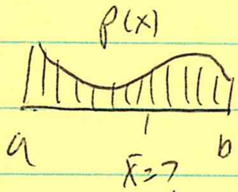
If there are several weights

$$\bar{x} = \frac{m_1 x_1 + m_2 x_2 + \cdots + m_n x_n}{m_1 + \cdots + m_n} = \frac{\sum_{i=1}^{n} m_i x_i}{\sum_{i=1}^{n} m_i}$$

weighted average

$\leftarrow$ total mass

Now let $\rho(x)$ be a linear density function, $\rho(x) = \dfrac{\text{mass}}{\text{length}}$.



Partition $[a,b]$ by $a = x_0 < x_1 < \cdots < x_n = b$.

Let $m_i = \rho(x_i)\Delta x$.

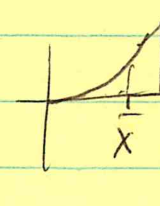
Then

$$\bar{x} \approx \frac{\sum m_i x_i}{\sum m_i} = \frac{\sum \rho(x_i) x_i \Delta x}{\sum \rho(x_i)\Delta x}$$

Take the limits as $n \to \infty$, $\Delta x \to 0$ to get

$$\bar{x} = \frac{\int_a^b \rho(x)\, x\, dx}{\int_a^b \rho(x)\, dx}.$$

Ex Let $\rho(x) = x^2$ over $[0,1]$. Find balance pt, $\bar{x}$.

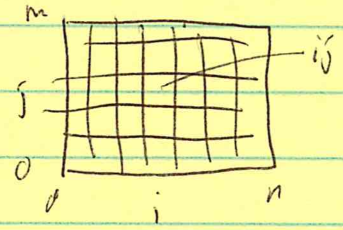


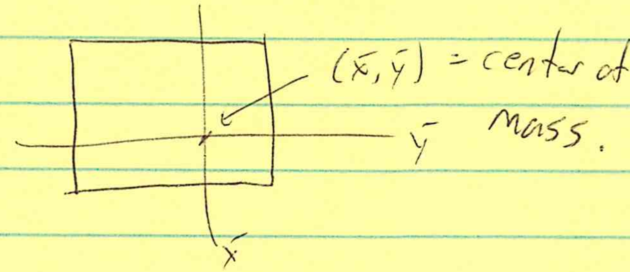
$$\bar{x} = \int_0^1 x^3\,dx \Big/ \int_0^1 x^2\,dx = \frac{1/4}{1/3} = \frac{3}{4}.$$

Now we want to generalize this to 2-dimensions

Let $\rho(x,y)$ be a density over a rectangle R; $\rho(x,y) = \frac{\text{mass}}{\text{area}}$

Let R be $[a,b]\times[c,d]$. Partition as below





Let $m_{ij} = \rho(x_i, y_j)\Delta x \Delta y \approx$ mass in cell ij.

Let's find $\bar{x}$. Let $M_i = \sum_{j=1}^{m} m_{ij} \approx$ mass of column i.

Then

$$\bar{x} \approx \frac{\sum M_i x_i}{\sum M_i} = \frac{\sum\sum x_i \rho(x_i,y_j)\Delta x \Delta y}{\sum\sum \rho(x_i,y_j)\Delta x \Delta y}$$

Take limits to get

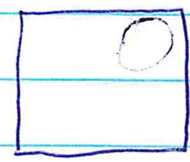
$$\bar{x} = \frac{\int_c^d\int_a^b x\,\rho(x,y)\,dx\,dy}{\iint \rho(x,y)\,dx\,dy} = \frac{M_y}{M}$$

$\leftarrow$ mass

Likewise

$$\bar{y} = \frac{M_x}{M} = \frac{\iint y\,\rho(x,y)\,dx\,dy}{\iint \rho(x,y)\,dx\,dy}$$

Ex Find the mass and center of mass of the square $[0,1]\times[0,1]$, with density $\rho(x,y) = x^2+2y+1$



$$M = \int_0^1\int_0^1 x^2+2y+1 \, dx\,dy = \int_0^1 \tfrac{1}{3} + 2y+1 \, dy$$
$$= \tfrac{4}{3}+1 = \tfrac{7}{3}$$

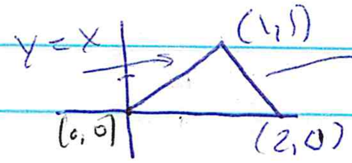
$$M_y = \int_0^1\int_0^1 x(x^2+2y+1)\, dx\,dy = \tfrac{5}{4}.$$

$$M_x = \int_0^1\int_0^1 y(x^2+2y+1)\, dx\,dy = \tfrac{4}{3}.$$

$$\bar{x} = \frac{M_y}{M} = \frac{5/4}{7/3} = \frac{15}{28} \approx 0.5357142$$

$$\bar{y} = \frac{M_x}{M} = \frac{\frac{4}{3}}{\frac{7}{3}} = \frac{4}{7} = \frac{16}{28} \approx 0.571428571$$

Ex Let R be the triangular region below. Let $\rho(x,y) = xy$ be a density function. Find the mass and center of mass.



$y = -x+2$

$x = -y+2 = 2-y$

$$\boxed{\text{Mass}} = \int_0^1 \int_y^{2-y} xy \, dx\,dy = \int_0^1 \frac{1}{2}x^2 y \Big|_y^{2-y} dy$$

$$\frac{1}{2}\int_0^1 (2-y)^2 y - y^3 \, dy = \frac{1}{2}\int_0^1 4y - 4y^2 + \cancel{y^3} - \cancel{y^3} \, dy$$

$$= 2\int_0^1 y - y^2 \, dy = 2\left(\frac{1}{2} - \frac{1}{3}\right) = \frac{2}{6} = \boxed{\frac{1}{3}}$$

$$\boxed{M_x} = \int_0^1 \int_y^{2-y} xy^2 \, dx\,dy = \cdots = 2\int_0^1 y^2 - y^3 \, dy = 2\left(\frac{1}{3} - \frac{1}{4}\right) = \frac{2}{12} = \boxed{\frac{1}{6}}$$

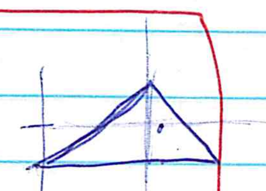
$$\boxed{M_y} = \int_0^1 \int_y^{2-y} x^2 y \, dx\,dy = \int_0^1 \frac{1}{3}x^3 y \Big|_y^{2-y} dy =$$

$$\frac{1}{3}\int_0^1 (2-y)^3 y - y^4 \, dy = \frac{1}{3}\int_0^1 [8 - 12y + 6y^2 - y^3]y - y^4 \, dy$$

$$= \frac{1}{3}\int_0^1 8y - 12y^2 + 6y^3 - 2y^4 \, dy = \frac{1}{3}\left(\frac{8}{2} - \frac{12}{3} + \frac{6}{4} - \frac{2}{5}\right)$$

$$= \frac{1}{3}\left(\frac{3}{2} - \frac{2}{5}\right) = \frac{1}{3}\left(\frac{15-4}{10}\right) = \boxed{\frac{11}{30}}.$$

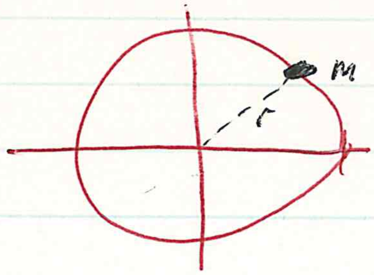
$$\bar{x} = \frac{M_y}{M} = \frac{\frac{11}{30}}{\frac{1}{3}} = \frac{11}{10} = 1.1$$



$$\bar{y} = \frac{M_x}{M} = \frac{\frac{1}{6}}{\frac{1}{3}} = \frac{1}{2} = 0.5$$

Rotational Inertia

Idea:

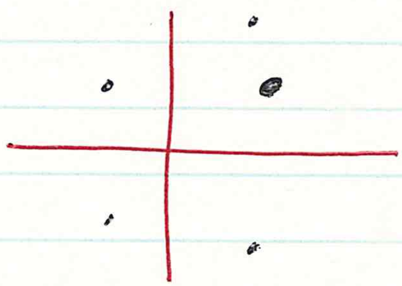


$$\omega = \frac{d\theta}{dt}$$

arc length is $r\theta$.

$$V = r\omega$$

$$E = \frac{1}{2} m V^2 = \frac{1}{2} \underbrace{m r^2}_{I_0 \text{ or } I_z} \omega^2$$



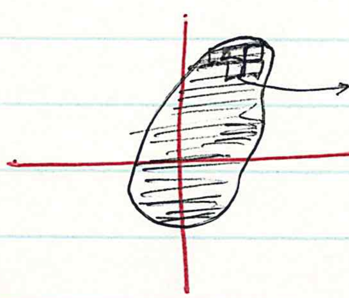
(Same ω).

$$E = \sum \frac{1}{2} m_i v_i^2$$

$$= \sum \frac{1}{2} m_i r_i^2 \omega^2 =$$

$$\frac{1}{2} \left(\sum m_i r_i^2 \right) \omega^2$$

$$= \frac{1}{2} I_0 \omega^2$$



$\Delta m_{ij} \approx \rho(x_i, y_j) \Delta x \Delta y$

$$E \approx \frac{1}{2} \left(\sum\sum \Delta m_{ij} r_{ij}^2 \right) \omega^2 \rightarrow \frac{1}{2} \left(\sum\sum r_{ij}^2 \rho(x_i, y_j) \Delta x \Delta y \right) \omega^2$$

$$E = \text{limit} = \frac{1}{2} \left(\iint_R r^2 \rho(x,y)\, dx\, dy \right) \omega^2$$

$$\text{or} = \frac{1}{2} \left(\iint \rho(r,\theta)\, r^3\, dr\, d\theta \right) \cdot \omega^2$$

$$\boxed{I_0 = \iint_R r^2 \rho \, dA}$$

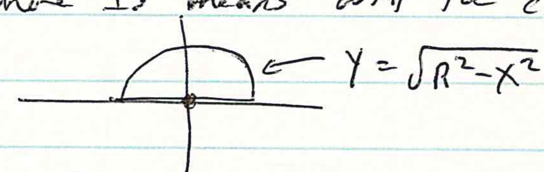
Notice, $I_0 = \iint (x^2+y^2)\rho \, dx\,dy =$

$$\underbrace{\iint x^2 \rho \, dx\,dy}_{= I_y} + \underbrace{\iint y^2 \rho \, dx\,dy}_{= I_x} .$$

$$I_z = I_0 = I_x + I_y ,$$

Ex Find I_0 for the ~~region~~ semi-circle with radius R and density proportional to the distance from the diameter, where I_0 means wrt the circle's center.

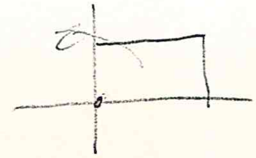
Sol.



$\rho(x,y) = ky$, for some $k>0$.

$$I = \int_0^{\pi}\int_0^{R} k r \sin\theta \, r^3 \, dr\,d\theta = k\int_0^{\pi} \frac{R^5}{5} \sin\theta \, d\theta =$$

$$\frac{2}{5} k R^5 .$$



Ex Find I_o for the rectangle $[0,2]\times[0,1]$ with $\rho(x,y) = 3x+2y+1$.

Sol. $I_x = \int_0^1 \int_0^2 y^2(3x+2y+1)\,dx\,dy$

$= \int_0^1 \int_0^2 3xy^2 + 2y^3 + y^2 \,dx\,dy$

$\int_0^1 \frac{3x^2y^2}{2} + (2y^3+y^2)x \Big|_0^2 \,dy$

$= \int_0^1 6y^2 + 4y^3 + 2y^2 \,dy$

$= \frac{8y^3}{3} + y^4 \Big|_0^1 = \frac{8}{3} + 1 = \frac{11}{3} = 3\frac{2}{3}$

$I_y = \int_0^1 \int_0^2 x^2(3x+2y+1)\,dx\,dy$

$= \int_0^1 \int_0^2 3x^3 + 2x^2y + x^2 \,dx\,dy =$

$= \int_0^1 \frac{3\cdot 16}{4} + \frac{2\cdot 8\,y}{3} + \frac{8}{3}\,dy = \int_0^1 \frac{16}{3}y + \frac{44}{3}\,dy$

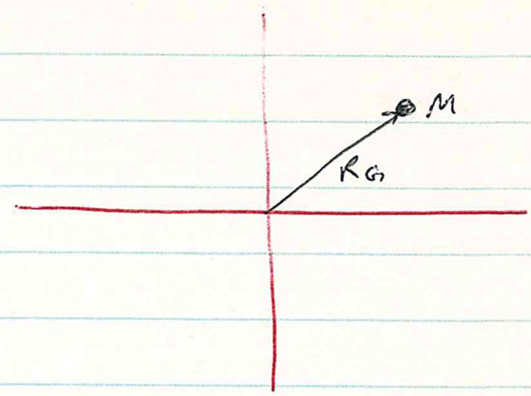
$= \frac{8}{3} + \frac{44}{3} = \frac{52}{3} = 17\frac{1}{3}$

$I_0 = 3\frac{2}{3} + 17\frac{1}{3} = 21.$

$E = \frac{1}{2} I_o \omega^2$

Radias of Gyration.

Let $R_G = \sqrt{\frac{I_0}{M}}$



$I = MR_G^2 = I_0$

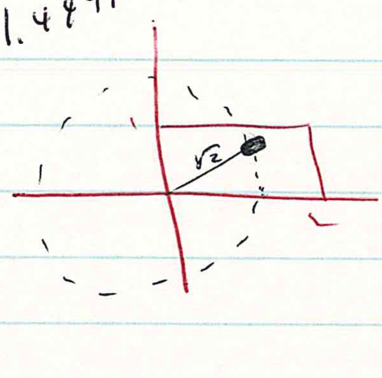
Ex The radias of Gy of the last example is,

$$R_G = \sqrt{\frac{2\cancel{0}}{M}}$$

$$M = \int_0^1 \int_0^2 3x + 2y + 1 \, dx\, dy =$$

$$= \int_0^1 6 + 4y + 2 \, dy = 8 + 2 = 10$$

$$R_G = \sqrt{\frac{21}{10}} \approx 1.449137675\ldots$$



$\cancel{E = \frac{1}{2}\cdot(10\cdot\sqrt{2})^2\omega = 10\omega}$

Ex A disk with radius 1 meter and mass 3 kg is moving 10 m/s in a straight line and spinning 5 revolutions per second. It has uniform density. Find the total kinetic energy.

Sol $E = \frac{1}{2}mv^2 + \frac{1}{2}I_0\omega^2$. We know m and v, and $\omega = 5\frac{\text{rev}}{\text{sec}} = 5\frac{\text{rev}}{\text{sec}} \cdot 2\pi\frac{\text{radians}}{\text{rev}} = 10\pi\frac{\text{radians}}{\text{sec}}$. We just need to find I_0.

$$I_0 = \int_0^{2\pi}\int_0^1 r^2 \rho\, r\, dr\, d\theta. \qquad \rho = \frac{\text{mass}}{\text{area}} = \frac{3\text{ kg}}{\pi\text{ m}^2}$$

$$I_0 = \frac{3}{\pi}\int_0^{2\pi}\int_0^1 r^3\, dr\, d\theta = \frac{3}{\pi}\,\frac{1}{4}\cdot 2\pi = \frac{3}{2}.$$

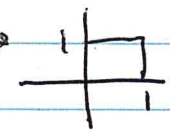
Thus, $E = \frac{1}{2}\cdot 3(10)^2 + \frac{1}{2}\left(\frac{3}{2}\right)(10\pi)^2 = 150 + 75\pi^2$

≈ 890.22 J.

Joules $= \frac{\text{kg m}^2}{\text{s}^2}$

Additional Examples if Time Permits

Ex Let R be the square $[0,1]\times[0,1]$, Let $\rho(x,y) = xy+1$. Find the mass, the center of mass, the rotational inertia wrt to $(0,0)$ and the radius of gyration.



Sol $M = \int_0^1\int_0^1 xy+1\,dx\,dy = \int_0^1 \frac{1}{2}y+1\,dy = \frac{1}{4}+1 = \frac{5}{4}$.

$M_x = \int_0^1\int_0^1 y(xy+1)\,dx\,dy = \int_0^1\int_0^1 xy^2+y\,dx\,dy = \int_0^1 \frac{1}{2}y^2+y\,dy$

$= \frac{1}{6}+\frac{1}{2} = \boxed{\frac{2}{3}}$.

$M_y = M_x$ by symmetry. Look for short cuts like this!

Thus $\bar{x} = \bar{y} = \frac{2/3}{5/4} = \frac{2}{3}\cdot\frac{4}{5} = \frac{8}{15}$. The $\boxed{C.M. = \left(\frac{8}{15},\frac{8}{15}\right)}$.

center of mass.

$I_x = \int_0^1\int_0^1 y^2(xy+1)\,dx\,dy = \int_0^1\int_0^1 xy^3+y^2\,dx\,dy$

$= \int_0^1 \frac{1}{2}y^3+y^2\,dy = \frac{1}{2}\cdot\frac{1}{4}+\frac{1}{3} = \frac{11}{24}$.

$I_y = I_x$ by symmetry. Thus, $I_0 = \frac{11}{24}+\frac{11}{24} = \frac{22}{24} = \frac{11}{12}$.

$R_G = \sqrt{\frac{I_0}{M}} = \sqrt{\frac{11/12}{5/4}} = \sqrt{\frac{11}{15}} \approx \boxed{0.8563.}$

Done!

Ex Let R be the region determined by $0 \le r \le 1+\cos\theta$. The density is proportional to the distance from the x-axis. Find M, $\bar{x}$, $\bar{y}$, I_0, and R_G.

Sol Graph the region.  It is a cardiod — a hart shape.

Find the density function. $\rho(x,y) = k|y| = kr|\sin\theta|$.
↑ for some k

Notice both the region and the densisty are symmetric across the x-axis.

$$M = \int_0^{2\pi}\int_0^{1+\cos\theta} kr|\sin\theta|\, r\,dr\,d\theta = k\int_0^{2\pi}\int_0^{1+\cos\theta} r^2|\sin\theta|\,dr\,d\theta$$

$$= 2k\int_0^{\pi}\int_0^{1+\cos(\theta)} r^2 \sin\theta\,dr\,d\theta = 2k\int_0^{\pi} \frac{r^3}{3}\sin\theta\Big|_0^{1+\cos\theta}\,d\theta$$

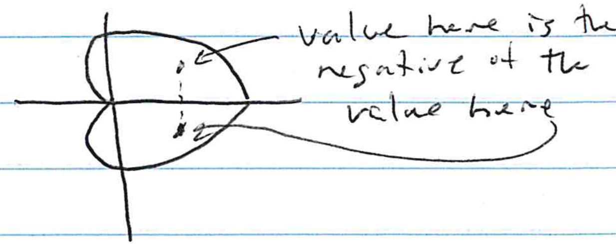
$$= \frac{2k}{3}\int_0^{\pi}(1+\cos\theta)^3\sin\theta\,d\theta.$$

Let $u = 1+\cos\theta$. Then $du = -\sin\theta\,d\theta$ and u goes from 2 to 0. Thus,

$$M = \frac{-2k}{3}\int_2^0 u^3\,du = \frac{2k}{3}\int_0^2 u^3\,du = \frac{2k}{3}\,\frac{16}{4} = \boxed{\frac{8}{3}k}.$$

$$M_x = \int_0^{2\pi} \int_0^{1+\cos\theta} \underbrace{(r\sin\theta)}_{= y} \, k r |\sin\theta| \, r \, dr \, d\theta = \boxed{0.}$$

Why? This integrand is odd w.r.t. y.



$$M_y = \int_0^{2\pi} \int_0^{1+\cos\theta} \underbrace{(r\cos\theta)}_{= x} \, k r |\sin\theta| \, r \, dr \, d\theta$$

$$= 2k \int_0^{\pi} \int_0^{1+\cos\theta} r^3 \cos\theta \sin\theta \, dr \, d\theta$$

$$= \frac{2k}{4} \int_0^{\pi} (1+\cos\theta)^4 \cos\theta \sin\theta \, du$$

Let $u = 1+\cos\theta$. Then $du = -\sin\theta \, d\theta$ and u goes from 2 to 0. Also notice $\cos\theta = u-1$. Thus

$$M_y = -\frac{k}{2} \int_2^0 u^4(u-1)\,du = \frac{k}{2} \int_0^2 u^5 - u \, du$$

$$= \frac{k}{2}\left(\frac{2^6}{6} - \frac{2^2}{2}\right) = k\left(\frac{2^4}{3} - 1\right) = k\left(\overset{\frac{16}{3} - \frac{3}{3}}{5\tfrac{1}{3} - 1}\right)$$

$$\boxed{= \frac{13}{3} k.}$$

~~C.M. is (0,~~

$$\bar{x} = \frac{0}{M} = 0. \quad \bar{y} = \frac{M_x}{M} = \frac{\frac{13}{3}k}{\frac{8}{3}k} = \frac{13}{8}$$

$$C.M. = \boxed{\left(0, \frac{13}{8}\right)}.$$

We knew by symmetry.

$$I_0 = k\int_0^{2\pi}\int_0^{1+\cos\theta} r^2 \, r|\sin\theta| \, r\,dr\,d\theta =$$

$$2k\int_0^{\pi}\int_0^{1+\cos\theta} r^4 \sin\theta \, dr\,d\theta =$$

$$\frac{2k}{5}\int_0^{\pi} (1+\cos\theta)^5 \sin\theta \, d\theta.$$

Let $u = 1+\cos\theta$. Then $du = -\sin\theta\,d\theta$, $u = 2$ to 0.

$$I_0 = -\frac{2k}{5}\int_2^0 u^5\,du = \frac{2}{5}k\int_0^2 u^5\,du = \frac{2}{5}k \frac{u^6}{6}\Big|_0^2 = \boxed{\frac{64}{15}k}.$$

$$R_G = \sqrt{\frac{I_0}{M}} = \sqrt{\frac{\frac{64}{15}k}{\frac{8}{3}k}} = \sqrt{\frac{16}{5}} = \frac{4}{\sqrt{5}} \approx \boxed{1.78885}$$

Done!
